Research Interests

My research spans human-computer interaction, artificial intelligence, and robotics, turning people's often-implicit expectations into shared representations that people can shape and AI agents can act on. These expectations matter because, as agents increasingly act on people's behalf, carrying out a request well requires accounting not only for what people explicitly ask but also for what they may never think to state. They are difficult to address because people often take them for granted and cannot articulate them all in advance, while agents cannot reliably infer what remains unstated.
